

Attended Geothermal Power Meeting in USA

For three days on October 1st to the 3rd, Reno, Nevada in the United States was the site of this year's Geothermal Resources Council 2007 (GRC 2007). There, FES setup a booth exhibition, and presented research work; both drew the attention of many of our customers.

GRC is an annual event sponsored by the group of the same name in a city on the west coast of the United States. GRC is an industry organization established for the development of geothermal resources. At this event, participants have the valuable opportunity to exhibit their product and technologies and present written research relating to that topic. Each year, leaders and researchers in the industry come from all over the globe to participate. FES eagerly participates each year as one of the leading companies in the area of geothermal-based electric power generation.

In the last several years, this event has begun to blossom and become rich with information because of the arrival of a geothermal-energy boom since the rush toward geothermal-based construction witnessed in the United States during the 1980's.
